D06 · Logistics Governance & Analytics

02 · Logistics organization, talent & digital skills

Supply Chain Reference Architecture v2.2 · mrsupplychain.ai

1 WHAT IT IS

The logistics organization defines the roles, structure and competencies — operational, analytical, commercial and digital — that a logistics function needs, and the development plan to build them.

2 WHY IT MATTERS

Systems and data only create value when people can use them. **Most logistics teams are strong in execution and weak in analytics, which leaves expensive TMS and WMS investments underused.** Leaders who can translate operations into margin and cash also gain influence over resource decisions that technical arguments alone do not win.

3 HOW IT IS DONE

1. **Define the role map.** Which roles exist, what each decides and which competencies each requires.
2. **Assess the team against it.** Skill matrix for operations, systems, analytics and partner management.
3. **Close gaps with structured programs.** Certifications where useful, internal academies on the company's own data and systems.
4. **Rotate and develop leaders.** Exposure to warehouse, transport and planning, plus finance and commercial language.

IN PRACTICE

Treat digital upskilling as a core investment, not a side project

The return appears in better decisions, faster analysis and higher utilization of existing systems.

Rotate people across warehouse, transport and planning

The best logistics leaders understand the constraints of all three domains from the inside.

Ensure the Logistics Director can speak finance and commercial language

Logistics owns 5–12% of revenue. Influence at the leadership table requires translation into margin, cash and customer impact.

ILLUSTRATIVE CASE

Illustrative case built from typical industry values — not data from a specific company.

Illustrative case — Distribution company, 12-person logistics team competency assessment

Competency	Current State	Gap Action
TMS proficiency	6/12 strong	Targeted certification + process standardization
Data analysis (Power BI / SQL)	2/12 capable	Structured 8-week internal academy
Carrier / 3PL commercial management	4/12 experienced	Joint negotiation training + shadowing
Network design literacy	1/12	Selected analysts rotated into design projects

Result: After 12 months the team produced its own cost-to-serve models and carrier scorecards instead of waiting for external support. Decision cycle time on operational issues shortened noticeably.

HOW IT IS MEASURED

Digital Skills Coverage %

(Team members proficient in core digital tools / Total logistics headcount) × 100

Benchmark: >70% TMS proficiency · >50% basic analytics capability are reasonable medium-term targets

Logistics Productivity (revenue or units per logistics FTE)

Output measures relative to logistics headcount

Benchmark: Rising trend indicates that technology and process improvements are translating into leverage

WHAT YOU WOULD USE

Talent & Capability

CSCMP / ASCM (CSCP, CLTD) / local university programs — Structured external certifications that raise both skill and external credibility.

Internal academies built on Power BI + TMS + process cases — Often more effective than generic external courses because they use the company's own data and systems.

4 SO WHAT

Build analytical and digital skills on purpose. Map roles and competencies, assess honestly, train on your own data and develop leaders who speak operations and finance.
